

Infrastructure Setup — One-Pager

Executive Board Intelligence — Project Setup. This is the Azure infrastructure we need to stand up for this initiative — identity, network, data and AI capacity, provisioned from scratch, in the order below.

PROVISION THIS

COMPONENT	STATUS	SETUP
SSO — Entra ID	REQUIRED	App registration, platform SPA. Redirect <frontend>/auth/microsoft/callback. Scopes openid profile email User.Read. Client/tenant IDs are baked in at build time — a wrong value means a rebuild, not a config edit. Backend validates no tokens; this covers the browser only.
Network / private endpoints	REQUIRED	Private endpoint on Postgres, Storage, Azure OpenAI. Backend Container App joins the VNet; ingress internal-only — it has no auth of its own. Any gateway in front of the chat stream must disable response buffering (SSE) or streaming breaks silently.
Database	REQUIRED	Postgres Flexible Server 16. Allow-list vector under azure.extensions before first boot — the app runs CREATE EXTENSION itself. Always sslmode=require.
Storage	REQUIRED	Blob container executive-board-intelligence-corpus. Backend's managed identity needs Storage Blob Data Contributor at account scope.
AI / PTU	REQUIRED — PTU	Provisioned Throughput (PTU) deployment in UAE North, per model (gpt-6-sol, text-embedding-3-large, TTS/STT) — 100 PTU reserved capacity, billed hourly regardless of use. Confirm each model's PTU availability in UAE North first; request quota early, it is usually the longest lead time in this list.
Secrets	RECOMMENDED	Key Vault for OPENAI_API_KEY and session secrets — referenced by the Container Apps, never inlined into app settings. Postgres uses Azure AD / managed identity authentication, so no database password is stored anywhere.
Compute	REQUIRED	Azure Container Apps — one frontend, one backend, fixed at 1 replica each, no autoscale. Sized for 4–5 named users, not public traffic; 2 vCPU / 4 GiB each covers the boot-time embedding warm-up with headroom. Built-in ingress is SSE-safe by default, which App Gateway is not without extra care.
Market intelligence	REQUIRED	Needs a live connection to the Bloomberg API for market intelligence — API credentials in Key Vault, an egress path out of the otherwise internal-only backend network to reach it, and a scheduled job to refresh articles in.

PROVISIONING ORDER

1. Request Azure OpenAI PTU quota in UAE North (start first — longest lead time) → 2. VNet + subnets → 3. Key Vault → 4. Postgres (private endpoint) → 5. Storage account + container → 6. Azure OpenAI PTU deployments (once approved) → 7. Entra ID app registration → 8. Backend Container App (internal ingress) → 9. Frontend Container App (public ingress) → 10. add the final redirect URI back into the app registration.
